

CLAIMS

1. (Previously Presented) A method for improved coded excitation of ultrasound beams, said method comprising:

encoding a first ultrasound beam with a first code, wherein said first code comprises a Golay code;

transmitting said first ultrasound beam on a first path;

encoding a second ultrasound beam with a second code, wherein said second code comprises a Golay code complementary to said first code;

transmitting said second ultrasound beam on a second path, wherein said second path is spatially adjacent to said first path;

receiving echo signals from said first and second ultrasound beams;

and

processing said echo signals from said first and second ultrasound beams to form an ultrasound line.

2-3. (Cancelled)

4. (Original) The method of claim 1, further comprising matched filtering of said echo signals.

5. (Original) The method of claim 1, further comprising lateral filtering across echo signals from adjacent scan lines.

6. (Original) The method of claim 5, wherein said lateral filtering comprises at least one of a lateral averaging filtering and a higher order finite impulse response filtering.

7. (Original) The method of claim 1, wherein said first and second ultrasound beams are encoded in first and second transmit focal zones and transmitted on said first path and said second path, wherein said first path equals said second path.

8. (Original) The method of claim 7, further comprising:
match filtering said echo signals received from said first and second ultrasound beams; and
averaging between said first and second transmit focal zones.

9. (Previously Presented) A method for single transmission coded excitation of signals, said method comprising:

encoding a plurality of signals with a plurality of complimentary codes, wherein each of said plurality of signals is encoded with one of said plurality of complimentary codes, wherein said codes comprise Golay codes;

transmitting said plurality of signals on a plurality of paths, wherein said plurality of paths are spatially adjacent; and

processing echo signals produced from said plurality of signals to form an ultrasound line.

10. (Cancelled)

11. (Original) The method of claim 9, further comprising filtering said echo signals.

12. (Original) The method of claim 9, further comprising match filtering said echo signals with corresponding matched filters.

13. (Original) The method of claim 9, further comprising lateral filtering a plurality of echo signals to form an image data signal.

14. (Previously Presented) An improved ultrasound imaging system for transmitted coded ultrasound signals, said system comprising:

a waveform generator for generating waveforms for a plurality of ultrasound signals, wherein said waveform generator encodes said waveforms for said plurality of ultrasound signals, said waveform generator encoding each of said plurality of ultrasound signals with a single code, wherein each code is a complementary Golay code;

a transducer for transmitting ultrasound beams based on said waveforms along a plurality of beam paths, said transducer capable of receiving

echo signals in response to said ultrasound beams, wherein said plurality of paths are spatially adjacent; and

a decoder for converting said echo signals to image data including processing said echo signals to form an ultrasound line.

15-16. (Cancelled)

17. (Original) The system of claim 14, wherein said decoder further comprises a matched filter for filtering said echo signals.

18. (Original) The system of claim 14, wherein said decoder further comprises at least one of a lateral averaging filter and a finite impulse response filter.

19. (Original) The system of claim 14, further comprising a beamformer for forming said ultrasound beams from said waveforms.

20. (Original) The system of claim 19, wherein said beamformer further comprises a multi-line beamformer, wherein said multi-line beamformer receives a plurality of echo signals in response to an ultrasound signal.

21. (Original) The system of claim 14, further comprising a memory capable of storing at least one of said waveforms and said echo signals.

22. (Original) The system of claim 14, further comprising a system controller for controlling an imaging mode and parameters of said system.

23. (Original) The system of claim 14, wherein said waveform generator encodes first and second ultrasound beams with first and second complimentary Golay codes, wherein said transducer transmits said first and second ultrasound beams in first and second focal zones along a beam path, wherein said decoder match filters echo signals received in response to said first and second ultrasound beams and averages said echo signals between said first and second focal zones.
